

## ALIA VALVE

Water softeners are useful in catering services, when operating coffee machines, dishwashers, ice-makers, steam ovens, etc.

Thanks to the versatility of the different models, choosing the one that mostly suits your needs is an easy task.

An alarm signaling the lack of salt is a feature characterizing **AL** softeners.

If no salt is left in brine, a warning based on visual and acoustic signals is triggered.

Thanks to such alarm feature, users are always updated on the actual step the softener is in.

The regeneration cycle is programmed by the softener timer.

Regeneration cycles will be carried out in an autonomous way; furthermore, they do not disrupt water flow.

The Alia valve is available in the Chronometric as well as Volumetric versions; they can both be installed on AL series softeners.
